 - Examples of Semantic Search Systems
 - Details of the Semantic Search Process
 - Ontology-based Interpretation of Keyword Queries
 - Natural Language Interfaces

- **Information Integration**
 - Ontology Mapping
 - Automated Mapping Discovery

“Traditional Search”

- Keyword-based
- “Meaning” of the information not interpreted by the machine

The screenshot shows a Google search interface for the keyword "kohl". The search bar contains "kohl" and the text "Moderater SafeSearch ist aktiviert" is displayed below it. Navigation buttons for "Bilder-Suche", "Web-Suche", "Erweiterte Bildsuche", and "Einstellungen" are visible. The search results are displayed in a grid with three items:

Image	Caption	Dimensions	File Type	Source
	Beim Kochen verströmt Jaroma Kohl ...	512 x 312	- 25k - jpg	www.marions-kochbuch.de
	Kohl im Museum gefunden!	375 x 500	- 39k - jpg	photokej.wordpress.com
	Preisträger Helmut Kohl	1296 x 1951	- 1425k - jpg	www.hss.de

Search on the Semantic Web ... is about Textual & Structured Data!

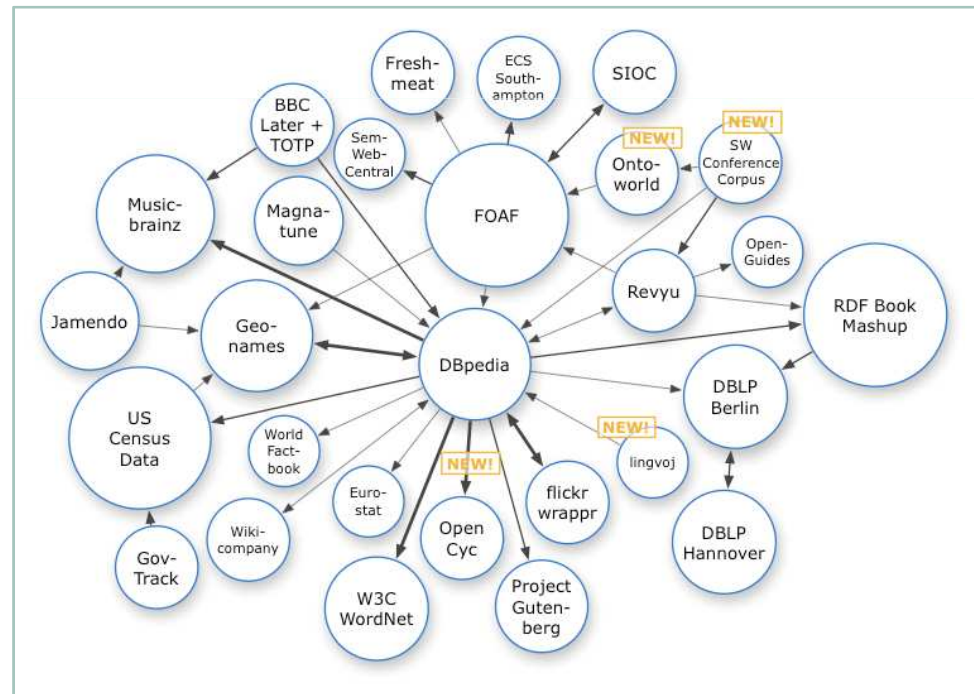

A Web of documents

- Billions of web pages
- Number ever increasing

A Web of data

- Deep Web
- Publicly available ontologies
- Open Linked Data
- More than 5 billion triples

Search from Information Retrieval Perspective

Information Retrieval Model is a quadruple $\langle D, Q, F, R(q_i, d_j) \rangle$

- D is a set composed of views (representations) for the **resources** (documents) in the collection.
 - Q is a set composed of views (representations) for the **user information needs** called queries.
 - F is a framework for modeling **resource representations, queries and their relationships**.
 - $R(Q_i, D_j)$ is a **ranking** function which associates a real number with a query Q_i and document representation D_j
 - Such ranking defines an ordering among the documents with regard to the query.
-
- Search based on classical Information Retrieval
 - Resources are text documents
 - User needs (queries) expressed as keyword
 - Simple syntactic matching of keywords against documents

What do we mean by Semantic Search?

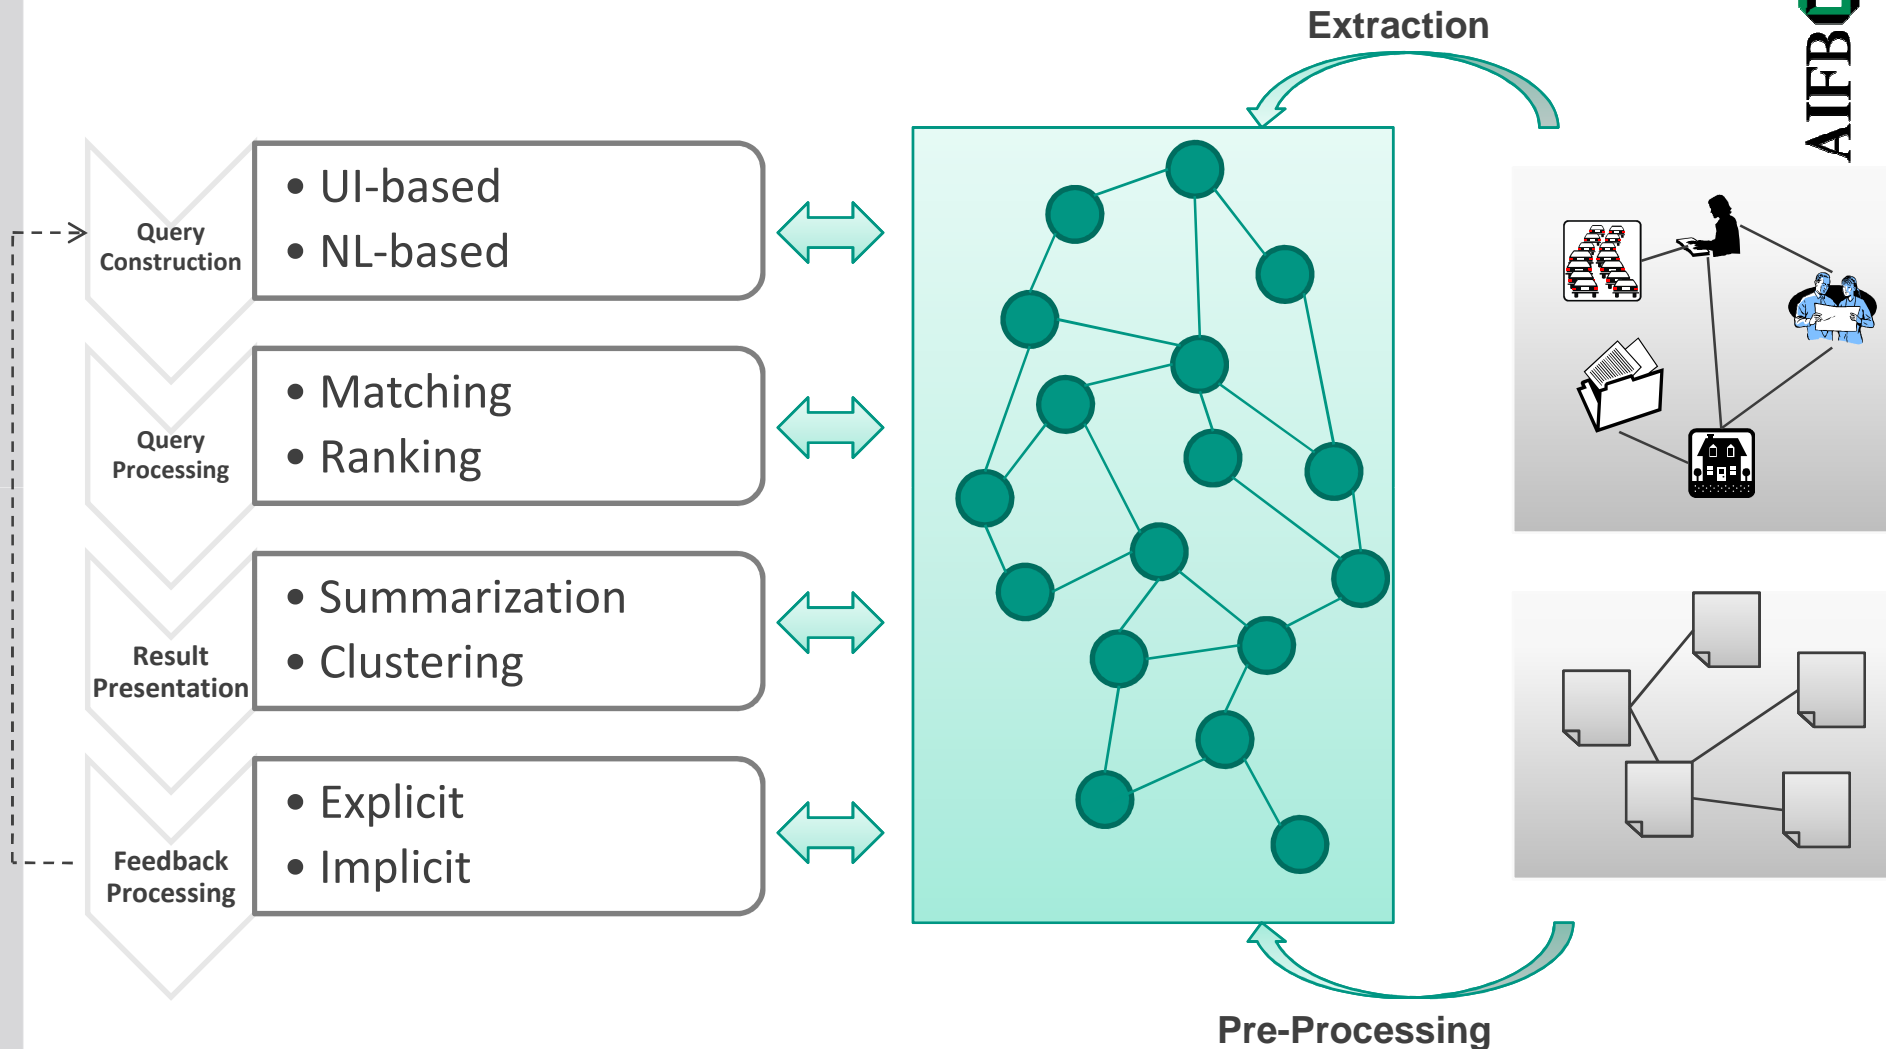

- Working definition:

"Semantic Search is a process of information access, where one or several activities can be supported by a set of functionalities enabled by semantic technologies"

- Terminology:

- Information: documents vs. facts
- Semantic technologies: knowledge extraction, knowledge representation, reasoning
- Ontology-enhanced IR vs. ontology-based IR

Semantic Search as a Process

Topics

- **Semantic Search**
 - Overview
 - **Examples of Semantic Search Systems**
 - Details of the Semantic Search Process
 - Ontology-based Interpretation of Keyword Queries
 - Natural Language Interfaces

- **Information Integration**
 - Ontology Mapping
 - Automated Mapping Discovery

Example: Semantic Wiki Search

- Operates on
 - **Semi-structured** wiki-data (OWL/RDF export)
- 1. Query construction
 - User expresses information needs in **keyword queries**
 - Automated translation into **structured, conjunctive queries** (SPARQL)
- 2. Query processing
 - User selects intended interpretation
 - Query processing using a **triple store**
- 3. Result presentation
 - **Structured answers** as results (tuple sets)
- 4. Feedback Processing
 - **Faceted browsing** to refine queries and results

1. Entering Keywords

[special](#)

Ask The Wiki

Step 1: Enter keywords

Step 2: Choose interpretation

Step 3: View and refine results

- Enter keywords for your search
- For example you might enter *rudi phone*, *country europe population*, *member aifb email*, or *editor license homepage status*.

Semantic Wiki Search^{beta}

Tomcat:HTTP/1.1 200 OK

0.01 sec

[Got feedback?](#) email [daniel!](#) 

2. Choosing the Interpretation

special

Ask The Wiki

New Search

Step 1: Enter keywords

Step 2: Choose interpretation

Step 3: View and refine results

- Your search returned **3** interpretations.
- Choose the interpretation** that fits your needs best by clicking on .
- Note: You can add/remove concepts and relations in the next step.

Legend: **Concepts** , **Relations** , **Labels**, **Literals**

Conference **Country in Eurozone: "Greece"** **Abstract deadline**

Has location country Abstract deadline

ESWC2009	Greece	2008-12-08 00:00:00
ECAI2008	Greece	2008-02-22 00:00:00

Conference **Country in Schengen zone: "Greece"** **Abstract deadline**

Has location country Abstract deadline

ECAI2008	Greece	2008-02-22 00:00:00

3. Result Presentation and Refinement

special

Ask The Wiki

New Search

Step 1: Enter keywords

Step 2: Choose interpretation

Step 3: View and refine results

- There are 2 results matching your interpretation.
- Use the **Facets** to the right to expand or narrow the results.

Legend: **Concepts** , **Relations** , **Labels**, **Literals**

Conference	Abstract deadline	Submission deadline
ECAI2008	Greece	2008-02-22 00:00:00
ESWC2009	Greece	2008-12-08 00:00:00

Facets

- Open/close a menu.
- Remove a concept.
- Add/remove a relation.
- Define a concept.

Conference

- Poster deadline
- Demo deadline
- Camera ready due
- Acceptance rate
- Event in series
- Has location city
- Paper deadline
- homepage
- Has location country
- Submission deadline
- Workshop deadline
- Tutorial deadline
- Notification
- Title
- Start date
- Abstract deadline
- End date

Country

Abstract deadline

Submission deadline

Sample Types of Queries

- Search for entities (pages)
 - Find the page describing Rudi Studer
 - „Rudi Studer“

- Search for single facts
 - Find the capital of Germany
 - „capital Germany“

- Search for sets of tuples
 - Conference planning: Find conferences taking place in Greece and their deadlines
 - „conference Greece deadline“

Example: Powerset

- Operates on
 - **Un-structured** web documents
- 1. Query construction
 - User expresses information needs in **natural language queries**
 - Deep linguistic analysis of content and queries
- 2. Query processing
 - Matching of linguistic structures
- 3. Result presentation and refinement
 - **Structured answers** as results (lists of entities)
- 4. Feedback Processing
 - **Faceted browsing** to refine queries and results

Topics

- **Semantic Search**
 - Overview
 - Examples of Semantic Search Systems
 - **Details of the Semantic Search Process**
 - Ontology-based Interpretation of Keyword Queries
 - Natural Language Interfaces

- Information Integration
 - Ontology Mapping
 - Automated Mapping Discovery

Query Construction – Task

- **Task:** “Query construction is the first step in the information access process that concerns with assisting the user in the **specification of the information need.**”
- **Result:** “A representation of the information need in terms of primitives of a language supported by the system.”
- Language supported by the system
 - keyword-based queries
 - database queries (SQL)
 - XML-based query language (XQuery, XPath, XML Fragments)
 - Semantic Web query languages (SPARQL, DL conjunctive queries, F-logic)
- Enhancement
 - user query is incomplete representation of the user information need
 - modification through expansion, disambiguation and refinement to achieve a more complete and precise representation of the need
- Translation
 - transformation of keywords- or NL-queries to a formal query

Query Construction – Advanced Approaches

- Interpretation of keywords
 - Keywords map to index containing ontology elements
 - Use **graph exploration** to compute possible connections
 - Map connections to elements of formal query
- Interpretation of Natural Language Queries using domain knowledge
 - Deep parsing query to obtain Part of Speeches (PoS)
 - **PoS maps** against element types of the knowledge base
 - Query elements are mapped against knowledge base instances
 - Typically requires rich lexical models

Query Processing – Task

- **Task:** “Query processing is a step in the information access process where the **need** as specified in the user query **is matched against the system resource model** so as to retrieve the (documents containing the) relevant information.”
- **Result**
 - “(A list of ranked documents containing) the information that satisfy the user need.”
 - Topical information need → documents about some topics (Document Retrieval)
 - Focused information need → document parts, e.g. section, passage (Focussed IR)
 - Exact information need → an answer to a question (Question Answering)
- Matching procedure is dictated by query and document representation
- “Terms-only” matching
 - Keywords-based queries / “Bag of words” resource models
 - Statistical IR approaches such as vector space model, probabilistic model, DFR etc.
- Incorporating syntactic information
 - Syntactic properties of the text language → Language Model
 - Syntactic properties of the query and resource representation → XML retrieval
- Incorporating semantic information
 - Representation of query and resources enhanced with ontology elements → ontology-enhanced IR
 - Representation of query and resources based on ontology elements → ontology-based IR

Result Presentation – Task

Ranking

- **Task:** “Finding appropriate **measures of relatedness** and use them to **rank results.**”
- **Result:** “A score for each of the results is calculated and results are sorted accordingly.”
- Kinds of relatedness
 - Lexical nearness of terms → synonyms, hyponyms, etc.
 - Topical nearness → buzzwords (politics, weather, etc)
 - Structural nearness → classical distance measure based on bag of words model
 - Ontological nearness → Concepts, Relations, Attributes, Instances
 - Heuristics → hyperlinks (Google’ page rank); anchor text, meta tag, page title,
- **Ontology-Driven Semantic Ranking for natural language disambiguation**
 - Using conceptual distance
 - Minimal path between concepts
 - Distance to common super concept

Result Presentation – Task

Clustering

- **Task:** “Group and label a given collection of patterns into meaningful clusters.”
- **Result:** “Thematically related documents are grouped together in the same clusters.”
- Clustering with background knowledge
 - Background ontology where terms matched to ontology elements
 - Integration of ontological knowledge in vector model, i.e. extending document term vector with additional dimensions representing ontological knowledge

Feedback Processing – Task

- **Task:** “The processing of user feedbacks aims to **exploit information from the interactions** to further satisfy the user information need.”
- Relevance feedback as standard paradigm
 - use information about which results of a query are perceived relevant for
 - tuning system parameters
 - suggesting new query (query refinement)
 - Feedback can be explicit or implicit (user behaviour)
 - Example: augment query with terms of relevant documents
 - Example: use feedback for disambiguation of query terms

Pre-Processing and Extraction – Task

- **Task:** “Pre-processing and extraction are **offline** tasks that are required to **develop a representation of the resources** available in the system.”
- **Result:** “A model supported by the system that captures the information content contained in the resources.”
- Model supported by the system
 - Bag-of-words
 - Structured model representation (XML documents)
 - Ontology-based model representation
- The more sophisticated the system resource model, the harder is pre-processing and extraction
 - Bag-of-words mostly developed using
 - tokenization
 - Lemmatization only.
 - Identification of syntactic and semantic information from the resources
 - PoS parsing
 - Extraction of instances, relations and expressive axioms

Pre-Processing and Extraction – Approaches

- Domain-Specific
 - more sophisticated domains (e.g. Chemistry)
- Semi-Supervised Information Extraction
 - Deriving Taxonomies
 - Relation Extraction from the Web
 - Mining Wikipedia
- „Open“ Information Extraction
 - extract relations that are not user-defined
- Linguistically heavy approaches
 - Deep parsing

Topics

- **Semantic Search**
 - Overview
 - Examples of Semantic Search Systems
 - Details of the Semantic Search Process
 - **Ontology-based Interpretation of Keyword Queries**
 - Natural Language Interfaces

- Information Integration
 - Ontology Mapping
 - Automated Mapping Discovery

Motivation – Complex Information Needs

- Complex Information Need – a scenario

*“A user is searching the publications of the research institute AIFB using the information portal <http://www.aifb.uni-karlsruhe.de> . He might look for a **publication** that*

 - 1. was written by an **author** of the knowledge management research group,*
 - 2. deals with the **topic** of information retrieval and*
 - 3. **describes** a question answering system deployed in a corporate setting.”*
- Answering such an information need requires more expressiveness
 - More completely interpret the information need
 - **More precisely capture information about resources**

Query Processing

RESOURCE MODEL

Interpretation of Keywords as Conjunctive Queries

- An instantiation of the generic IR model
- User question a **set of keywords** $Q_U = (k_1, k_2, \dots, k_n)$
- System query
 - **Conjunction of terms** of the form $x : C$ and $\langle x, y \rangle : R$
 - Where C is a concept, R is a role, and x, y are variables or individuals taken from a set of variable names, or a set of individual names
- System resource model
 - OWL DL knowledge base
 - **Ontology entities:** sets of individuals, data values, concepts, data ranges, object properties and data properties
 - **Connections between entities** are captured by terminological axioms and assertions (concept and property membership)

Step 1 – Mapping Keywords to Ontology Entities

- Match
 - keywords against ontology entities
- “Robust” matching functions
 - **Syntactic variants**
 - **Spelling variants**
- Matching function
 - Index of ontology elements
 - **Fuzzy search** on index with each keyword
 - Return ontology entities ranked according to syntactic similarity

Step 2 – Exploring Connections among Ontology Entities

```
KB EXPLORATION( $\mathcal{O}_S, d$ )
1  INPUT entities  $\mathcal{O}_S$  and traversal width  $d$ 
2  OUTPUT graph containing all or some of  $\mathcal{O}_S$ 
3  Initialize new empty graph  $g$ 
4  for  $e \in \mathcal{O}_S$ 
5  do if  $e$  is a concept
6      then for all  $i$  being instances of  $e$ 
7          do I-P-I TRAVERSAL( $e, d, g$ )
8  else if  $e$  is an object property
9      then for all  $i, j$  with  $\langle i, e, j \rangle \in \mathcal{O}_S$ 
10         do I-P-I TRAVERSAL( $i, d, g$ )
11            I-P-I TRAVERSAL( $j, d, g$ )
12 else if  $e$  is a data property
13     then for all  $i, j$  with  $\langle i, e, j \rangle \in \mathcal{O}_S$ 
14         do J-P-I TRAVERSAL( $j, d, g$ )
15 else if  $e$  is an individual
16     then I-P-I TRAVERSAL( $e, d, g$ )
17 else if  $e$  is a data value
18     then J-P-I TRAVERSAL( $e, d, g$ )
19  return  $g$ 
```

- Algorithms for
 - Knowledge Base Exploration
 - Recursive traversal of elements
 - Adopted Depth First Search (DFS) for calculation of paths

Step 2 – Exploring Connections among Ontology Entities

I-P-I TRAVERSAL(i, d, g)

```
1  INPUT individual  $i$ , width  $d$ , intermediate graph  $g$ 
2  OUTPUT updated graph  $g$ 
3  if  $i$  not marked as visited and  $d > 0$ 
4    then
5      mark  $i$  as visited within  $O_S$ 
6       $C_i := \{c \mid i \text{ instance of } c\}$ 
7      add edge  $(i, \text{type}, c)$  to  $g$  for all  $c \in C_i$ 
8       $P := \{(i, p, j) \mid \langle i, p, j \rangle \in O_S\}$ 
9      for all  $(i, p, j) \in P$ 
10     do if  $j$  not marked as visited in  $O_S$ 
11       then add a new edge  $(i, p, j)$  to  $g$ 
12         if  $j$  is an individual
13           then I-P-I TRAVERSAL( $j, d - 1, g$ )
14           else J-P-I TRAVERSAL( $j, d - 1, g$ )
```

Algorithms for

- KB Exploration
- **Recursive traversal of elements**
- Adopted Depth First Search (DFS) for calculation of paths

Step 2 – Exploring Connections among Ontology Entities

PATH DFS(v, G, E, P, S)

```
1  INPUT vertex  $v$ , graph  $G$ , vertices  $E$ , path  $P$ , stack  $S$ 
2  OUTPUT the path  $S$  and labelled edges
3  Push  $v$  into stack  $S$ 
4  if  $v$  matches any  $e \in E$ 
5    then
6      if  $S$  not already in  $P$ 
7        then
8          Add  $S$  to  $P$ 
9          Empty  $S$  and push  $v$  into it
10     for in- and outgoing edges:  $e_{out}(v, w), e_{in}(w, v)$ 
11     do if  $w$  not already visited
12       then if  $w$  not already visited
13         then Set label of  $e$  as "discovered"
14         Push  $e$  into stack  $S$ 
15         PATH DFS( $w, G, E, P, S$ )
16         Pop  $e$  from  $S$ 
17       else Set label of  $e$  as "back"
18     Pop  $v$  from  $S$ 
```

- Algorithms for
 - KB Exploration
 - Recursive traversal of elements
 - **Adopted Depth First Search for calculation of paths**

Step 3 – Deriving Conjunctive Queries from Connections

CALCULATESUBGRAPHS(P, C, R, G, g)

```
1  INPUT the paths P by DFS for matching vertices  $\mathcal{O}'_s$ 
2  OUTPUT all subgraphs connecting vertices in  $\mathcal{O}'_s$ 
3  if  $R = \emptyset$ 
4    then  $G = G \cup g$ 
5  if  $g = \emptyset$ 
6    then  $G = \text{newGraph}$ 
7      for  $\{i, j\} \subseteq R$ 
8        do for each path p between i and j (as by DFS)
9          do add (i,p,j) to G
10         CALCULATESUBGRAPHS( $P \setminus p, C \cup \{i, j\}, R \setminus \{i, j\}, G$ )
11  else for  $i \in R$ 
12    do for  $j \in C$ 
13      do for for each path p between i and j
14        do
15          add (i,p,j) to G
16          CALCULATESUBGRAPHS( $P \setminus p, C \cup \{i\}, R \setminus \{i\}, G$ )
```

Compute possible
subgraphs

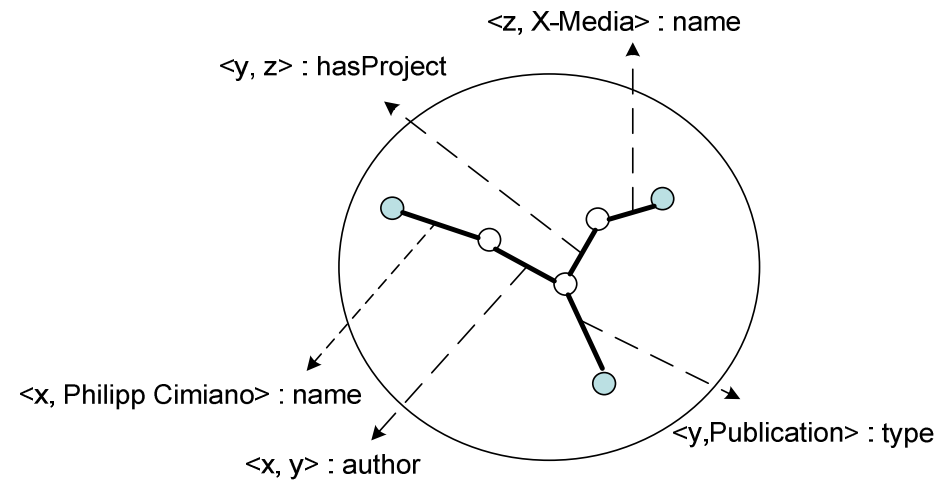

Mapping
Connections to
Queries

Rank Queries

Step 3 – Deriving Conjunctive Queries from Connections

- Compute possible subgraphs
- **Mapping Connections to Queries**
 - concept member connections and property member connections map to corresponding expressions
 - Vertices matching query elements become constants otherwise variables
- **Ranking Queries**
 - the smaller the length of the path, the more likely is the corresponding interpretation (locality assumption)
 - length of the longest path of the connection graph

Topics

- Semantic Search
 - Overview
 - Examples of Semantic Search Systems
 - Details of the Semantic Search Process
 - Ontology-based Interpretation of Keyword Queries
 - Natural Language Interfaces

- **Information Integration**
 - Ontology Mapping
 - Automated Mapping Discovery

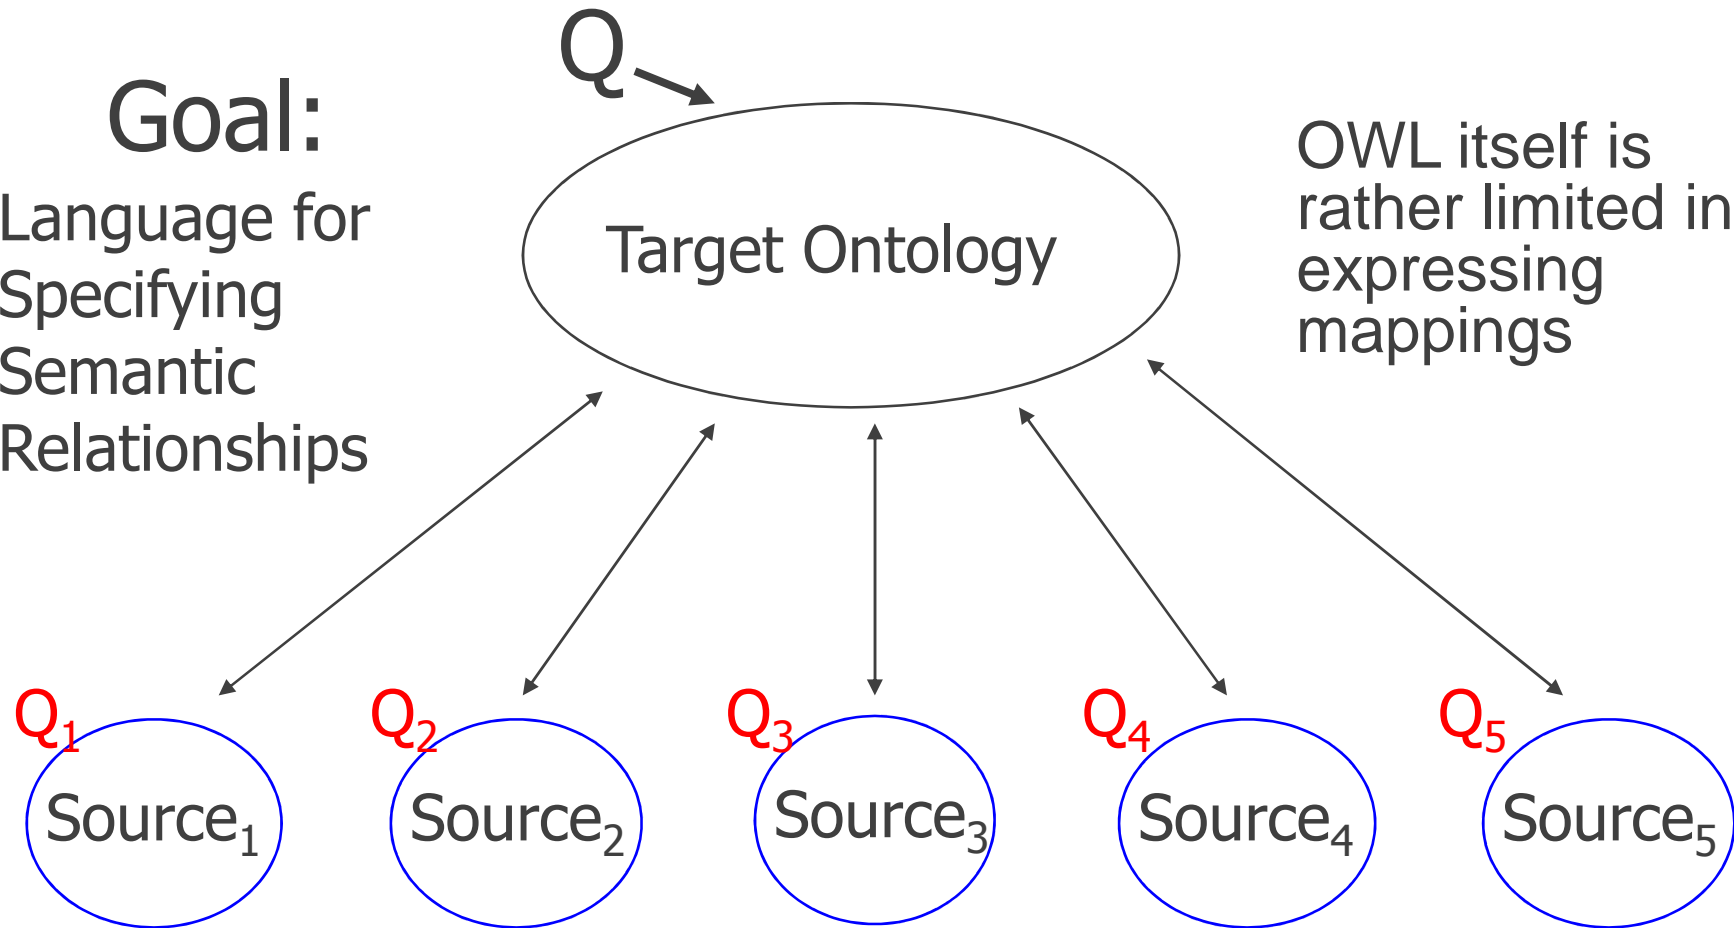

Ontology Mapping – Problem and Scope

- The Problem
 - *Heterogeneous ontologies require mappings for interoperability*
 - Numerous independent Ontologies
 - No single Domain Model
 - Modeling same or overlapping Knowledge
- Main challenges
 - Identifying mappings (correspondences between Entities)
 - Representing these Relations
 - Utilizing Mapping for querying, reasoning, ontology integration, translation and exchange

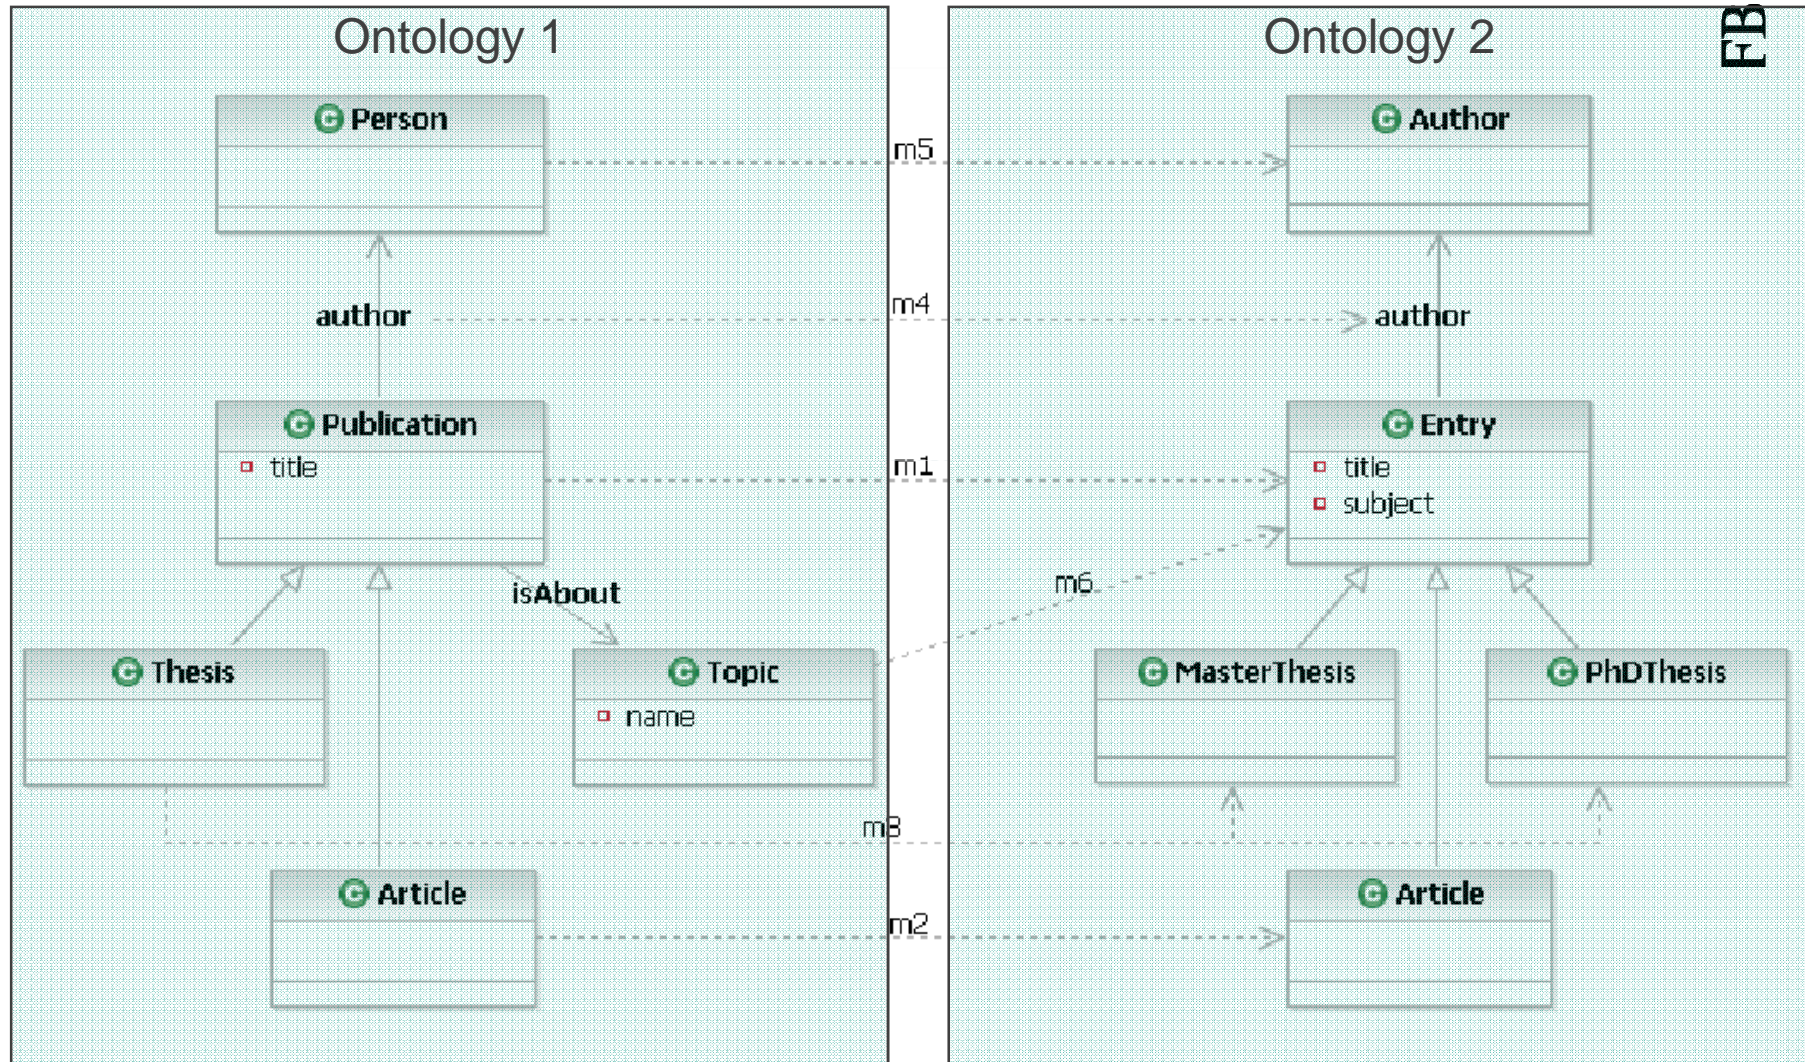

Mapping Systems for Ontology Integration

Goal:
Language for
Specifying
Semantic
Relationships

Sample Mapping

OWL DL Mapping System

- An **OWL DL mapping system** is a triple (S, T, M) , where
 - S is the **source** OWL DL ontology
 - T is the **target** OWL DL ontology
 - M is the **mapping** between S and T
- **Mapping: set of assertions**
 - $q_S \sqsubseteq q_T$ (**sound** mapping)
 - $q_S \sqsupseteq q_T$ (**complete** mapping)
 - $q_S \equiv q_T$ (**exact** mapping)
 - where q_S and q_T are **conjunctive queries** over S and T , respectively, with the same set of distinguished variables
- **Semantics** defined via translation into FOL, computing answers against $S \cup T \cup M$

[Haase and Motik, IHIS05]

Examples

- Correspondences between atomic elements
 - $s: \text{Publication}(x) \sqsubseteq t: \text{Entry}(x)$
 - $s: \text{author}(x,y) \sqsubseteq t: \text{author}(x,y)$
- Correspondences between complex class descriptions
 - $s: \text{Thesis}(x) \sqsubseteq t: \text{PhDThesis} \sqcup t: \text{MasterThesis}(x)$
- Even more complex mappings
 - $s: \text{Publication}(x) \wedge \text{isAbout}(x,y) \wedge \text{name}(y,z) \sqsubseteq t: \text{Entry}(x) \wedge \text{subject}(x,z)$

Ontology Mapping – Techniques and Tools

- Great number of Techniques
 - Syntactic, Semantic, External
 - Element-Level, Structure-Level
 - Schema or Instance Level mapping
- Mapping Tools
 - Several mapping systems already available
(*GLUE, PROMPT, FOAM, ONION, MAFRA*)
 - Manual, visual creation of mappings between ontologies
 - Integration of (relational databases): automated ontology lifting and query answering
(*OntoMap, ODEMapster*)
- Best results
 - Find best approximate Matches -> Similarity
 - Semi-automatic
 - Requires human Domain Expert

Ontology Mapping with OntoMap

Automated Mapping Discovery Process

Features and Similarity Measures

	<i>Feature</i>	<i>Similarity Measure</i>
Concepts	label	String Similarity
	subclassOf / superclassOf	Set Similarity
	instances	Set Similarity
	...	
Relations	Domain, Range	Set Similarity
	...	
Instances		

Similarity Measures

- String similarity

$$sim_{String}(s_1, s_2) = \max\left(0, \frac{\min(|s_1|, |s_2|) - ed(s_1, s_2)}{\min(|s_1|, |s_2|)}\right)$$

- Set similarity

$$sim_{Set}(S_1, S_2) = \text{avg} \max_{e_i \in S_i, e_j \in S_j} (sim(e_i, e_j))$$

Aggregation of multiple similarity measures

- Weighted combination method

- Manually
- Machine learning

$$\text{sim}(e, f) = \sum_k w_k \text{sim}_k(e, f)$$

- Non-weighted combination method

- Average
- Maximal
- Minimal

Summary

- Semantic Search: Search on the level of meaning
 - Interpretation of the user's information need
- Ontology Mapping: Integration of heterogeneous information sources
